Data Collection Plan & Raw Data Sources Identification Template

Elevate your data strategy with the Data Collection plan and the Raw Data Sources report, ensuring meticulous data curation and integrity for informed decision-making in every analysis and decision-making endeavor.

Data Collection Plan Template

Section	Description
Project Overview	Food Ordering Behaviour Analysis is a web-based analytics application that combines a Python Flask backend with a responsive, interactive Tableau Story visualization dashboard. The primary objective is to aggregate food order transaction data — cuisine demand, delivery performance, and consumer dining habits — into a unified, accessible interface, allowing business stakeholders to readily map out ordering behaviour and consumer trends across cities.
Data Collection Plan	Food order transaction records are extracted from structured order logs covering city, cuisine, meal type, company/dining segment, customer rating, delivery time, and order value. This utilizes a structured food ordering behavior dataset (CSV). The collected raw records are processed and normalized to feed into the Tableau engine via relational spreadsheet structures.
Raw Data Sources Identified	Two main data components have been identified to support the analytical stack: 1. Order Transaction Records: Captured order-level details including city, cuisine, meal type, and customer rating across each transaction. 2. Delivery & Company Segment Logs: Tracked delivery time, order value, restaurant type, and company/dining segment classification (Alone, Family, Friends, Partner) for each order.
