Project Title	Food Ordering Behaviour Analysis
Maximum Marks	3 Marks

Project Proposal (Proposed Solution) template

This project proposal outlines a solution to address a specific problem. With a clear objective, defined scope, and a concise problem statement, the proposed solution details the approach, key features, and resource requirements, including hardware, software, and personnel.

Project Overview	
Objective	To develop, integrate, and deploy the Food Ordering Behaviour Analysis dashboard, an interactive Tableau-based analytics application that translates complex food-ordering trends (cuisine demand, order volume, delivery time, ratings, and revenue) into accessible, dynamic, and shareable visual insights.
Scope	The scope includes collecting and preprocessing food ordering records, building a centralized Tableau Story presentation covering city-wise order volume, cuisine and meal-type analysis, customer ratings, delivery time distribution, and revenue contribution, embedding it into a lightweight Python Flask web application, and publishing the dashboard via Tableau Public / GitHub. It excludes building a live order-processing system or real-time delivery tracking.
Problem Statement	
Description	Food ordering platforms generate large volumes of transactional data (city, cuisine, meal type, company/dining segment, delivery time, ratings, and order value) that are often locked away in raw spreadsheets or disconnected records. Business teams lack a centralized, clear tool to cross-examine these metrics quickly during operational or strategic planning.
Impact	Resolving this challenge minimizes the time required for a business analyst to synthesize ordering behaviour and consumer trends, and empowers stakeholders with interactive filtering across cities, cuisines, and meal types, turning static order data into actionable operational and marketing decisions.
Proposed Solution	
Approach	Raw order data is extracted, cleaned, and refined into reliable subsets, passed to Tableau Public to generate a multi-layered analytical presentation flow (Tableau Story) with KPI cards, bubble maps, bar charts, and distribution histograms, and embedded responsively into an HTML frontend served by a Python Flask micro-framework.
Key Features	Unified Narrative: merges isolated KPI panels (order volume, ratings, delivery time, revenue) into a single interactive Tableau Story. Cloud-Native Delivery: publicly hosted and viewable via Tableau Public / Flask with no local environment dependency for the end-user. Interactive Filtering: viewers can explore data by city, cuisine, meal type, and company/dining segment (Alone, Family, Friends).

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	Local Development Engine	Standard laptop/desktop (no GPU required)
Memory	Local RAM	8 GB RAM minimum
Storage	Disk space for data, workbook, and exports	Max 500 MB
Software		
Frameworks	Python framework for web embedding	Python Flask

Resource Type	Description	Specification/Allocation
Libraries	Additional libraries	Gunicorn for stable cloud routing execution
Development Environment	IDE, version control	VS Code (or Text Editor), Terminal, Git, and GitHub UI
Data		
Data	Food ordering behaviour data	Food ordering behaviour dataset.csv (CSV format)
